

Hands-On Manufacturing Skills Assessment

Our validated assessments using portable machines and a hands-on, performance-based methodology identify the most skilled, most capable, and most trainable candidates and incumbents.

Standard Timing Model

This mechanical skills assessment tool is used to identify many mechanical skills and competencies, which collectively can be characterized as “Mechanical Troubleshooting Ability”. In addition to identifying and measuring pre-existing skills the program also identifies mechanical aptitude in individuals that have not yet been properly trained.

Electrical Skills Test Device

This device provides a means of quantitatively screening candidates for industrial electrician and electro-mechanic production positions. The ESTD identifies and measures a candidate’s understanding of the principles and fundamentals of electricity and how they are applied in an industrial setting.

PLC Test Device

This device identifies the troubleshooting skills of industrial equipment maintenance personnel. Much more than a written aptitude test, the PLC Testing Device is hands on, providing direct feedback from a test panel. The testing device evaluates job candidates and incumbents in the positions of maintenance personnel, technicians, and programmers responsible for the upkeep and troubleshooting of automated production lines and automated production equipment.

NEW

CNC Test Device

This device screens and trains CNC setup operators with production responsibilities, as well as quantitatively ranks and evaluates job applicants. The process evaluates candidates based on the speed and accuracy they use to complete the set of instructions.
